/Hassan Kizou/ Supervisory Patent Examiner, Art Unit 2419			

Continuation of 11. does NOT place the application in condition for allowance because: Applicant's arguments have been fully considered but they are not persuasive. Applicant contends that it would not have been obvoius to use two different Bluetooth addresses to identify a primary terminal because the Bluetooth standard specifically requires using only one address and because the Bluetooth standard does not support using two addresses. Examiner respectfully disagrees. The admitted prior art discloses a system in which a terminal is equippted with one single Bluetooth address for support of one single network. Bisceglia discloses a system in which a network device is equipped with multiple network addresses for support of multiple networks, one address for one network. And it is functionally achievable to have multiple Bluetooth addresses on one single device, e.g. combining multiple Bluetooth devices each with one Bluetooth device into one single device. One ordinary skill in the art would be motivated to do because it would allow one single device to support multiple networks. If it wasn't possible as suggested by Applicant, it would simply be functionally impossible for Applicant's invention to operate properly. Although it might be true that the Bluetooth standard itself does not motivate the use of multiple Bluetooth addresses on a single device, it does not eliminate such use of multiple addresses for connection idnetification. It is also noted that Bluetooth is a trademark and it is improper to use trademarks or trade names in a claim as a limitation to identify or describe a partular material or product; the value of a trademark would be lost to the extent that it became descriptive of a product, rather than used as an identification of a source or origin of a product.
